Vol. 5 No. 2
1953

662.933.8

33. The development of the additional firing of powdered coal for high capacity boilers fitted with travelling grates — *Szénporpótlótüzelés kifejlesztése nagyteljesítményű vándorrostélykazánokhoz* — J. Beér. (Hungarian Power Economy — *Magyar Energiagazdaság* — Vol. V. No. 4. April 1952, pp. 97—104, 12 figs., 3 tabs.)

Efficient firing with low-grade coals (containing 16 to 20 per cent moisture, 27 to 30 per cent ashes and with 3050 to 3450 kg-cal per kg calurific value) in boilers fitted with travelling grates and built for the combustion of firing high-grade brown coal may be achieved by the additional firing of powdered coal with impact blower mills. The quantity of powdered coal amounts to about 15 to 20 per cent of the entire quantity of coal. In furnaces constructed without arches the powdered coal produces "luminous" flames and the grate is shielded by the flame. The design of the heating equipment was elaborated through experiments, the fineness of pulverization, the most favourable rate and the most suitable method of firing were determined. The fly-ash content of the departing flue gases was also determined. With the described firing method the rated boiler output could be maintained with inferior quality coals as well.

BEESKE, O

WOOD WORKING

*105. Determining the power input of woodworking machines — O. Beeske. (*Holzforschung* — Vol. 1, 1954, No. 5, pp. 138—140, 1 figs., 2 tabs.)

Specific resistance in the cutting of wood is influenced by different factors: (1) The angle of fibre cutting; cutting can be effected in (a) cross grain direction, (b) longitudinal butt direction and (c) longitudinal-transverse direction. (2) The angle of intersection; when it is increased resistance increases with it, at 60° it is taken for a unit; the increase is not the same in all directions, it is the greatest for butt cutting and the smallest for cross cutting. (3) The depth of cutting; with increasing depth the resistance diminishes. (4) Species of wood; if fir is taken for one then e. g. lime and poplar are 0.82 to 0.86, oak and hornbeam 1.75 to 1.85. (5) The moisture content; specific cutting resistance decreases with the increase of moisture; 15% of moisture content (air dry) is taken for the unit factor, then 1.19 is the correction factor for 5—8% and 0.88 for 70% and above. 6) Cutting speed;

APPROVED FOR RELEASE: 06/06/2000 CIA-RDP86-00513R000204130009-2"

"APPROVED FOR RELEASE: 06/06/2000 CIA-RDP86-00513R000204130009-2

D. RECORE

its increase entails a moderate increase in resistance; 10 m/sec is taken for a unit, the velocity factor is 1.005. (7) Sharpness of the cutting edge; the factor is 1 – 1.6 for 6 working hours if an unused sharp knife is taken as unit. – Value K of the specific cutting resistance of the cutting tool may be derived from the above factors with the aid of the published tables and diagrams. Then, knowing the cross section of the shavings q, $P = K \cdot q$ in kg and the power input $N = \frac{P \cdot c}{75 \cdot 60 \cdot \eta}$ in HP where c = the feed of the machine in m/min and η = the mechanical efficiency of the machine ranging from 0.95 to 0.80.

Carburetting the Open-Hearth Furnace Flame. J. Beevár. (Hutník,)Prague), 1953, 2, Apr., 86-87). (In Czech).

The low density of coke-oven gas and some other gaseous fuels used in open-hearth furnaces leads to a low rate of heat transfer from flame to bath. The possibilities of enriching the fuel, with solid, liquid, or gaseous additions are examined. The use of about 30 lb. of tar per ton of steel was found economical and did not require special equipment.--P. P. D2.

AUTHOR: Befani, A. N.

TITLE: Questions on the Theory and Computation of Drainage (Voprosy teorii i rascheta stoka) .

PERIODICAL: Meteorologiya i Gidrologiya, 1957, Nr 12, p. 6 - 15 (USSR)

ABSTRACT: The drainage is formed according to a series of processes (fall-out, precipitations, melting, dehydration of the snow, absorption of the rain- and melting water into the ground, formation of water at the inclines , infiltration into the ground water, and others). During its development the drainage is passing a series of qualitatively peculiar stages - incline stage, bottom stage, inside-snow-stage, the gorge- and river stage, which have a series of sub-types, and others.
The empirical generalization of the normal hydrometrical data only expresses the approximative formulae, the structure of which may be selected almost ad libitum. The main significance of the theory is represented by the original argumentation of the structure of the computations. Besides, the theory methodically proves the experiment, and recovers the possibilities of its development in order to obtain the determination of parameters of the theoretical formulae.
The following ones are to consider as base of the theory: 1.) the

Questions on the Theory and Computation of Drainage

integrals of the correlations of the water economy, which express the summary water exchange between the uniform elements of the hydrosphere. 2.) the values of the water economy, i.e. the equation of the drainage. The integral equations of the water economy are necessary for the analysis, however, the development, i.e. the dynamics of the drainage only results from the solutions of the drainage equation, the matter of which represents the main content of the theory.

The further specifications may be divided into the following items, with exact computations and 25 formula

1.) equations of the water economy
2.) inflow of the atmospheric waters
3.) the absorption
4.) the formation of water
5.) the incline drainage
6.) the depression of the incline
7.) the total drainage
8.) the incomplete drainage
9.) the channel drainage
10.) rain floods
11.) the drainage in spring
12.) the subterraneous drainage

AUTHORS: Osmolovskiy, V.V. and Begagoyen, I.A., Dotsents of the Krivoy Rog Ore-Mining Institute; Babenko, S.F. and Khutornoy, P.S., Mining Engineers from the Plant "Kommunist"

TITLE: Improve the Utilization and Repair of Mining Equipment (Uluchshit' ekspluatatsiyu i remont zaboynogo oborudovaniya) Letter to Editorial Board (Pis'mo v redaktsiyu)

PERIODICAL: Gornyy Zhurnal, 1958, Nr 1, pp 79-80 (USSR)

ABSTRACT: Recently, the ore mines of the Krivoy Rog basin have been equipped with various types of mining machinery, which created the pre-requisite for a considerably rise in labor efficiency. However, these opportunities have not been fully utilized. The low indices of equipment utilization are explained by reasons of technical and organizational character. The authors of the letter propose a number of measures to improve the utilization, one of which is as follows: to convert the mines of the Krivoy Rog basin to a discontinuous regime of operation and assign special shifts or days for repair and preparatory work.

2086. BEGAJSKI J. and KAULBERSZ J. Zakł. Fizjologii A. M., Kraków. *Wpływ czynników hormonalnych na ciśnienie i tetno w pracy fizycznej. The effect of hormonal factors on blood pressure and pulse rate during physical effort ACTA PHYSIOL. POL. 1955, 6/3 (261-271) Graphs 5

The blood pressure was determined in the carotid artery indirectly in non-anaesthetized dogs. Physical effort following the i.v. injection of a neurohypophyseal extract lowered the increased blood pressure (systolic as well as diastolic). After s.c. injection of the extract the results were often the opposite. Muscular effort following i.v. adrenaline resulted in an additional slight rise in systolic pressure. Injection of an adrenal cortex extract before physical effort partly inhibited the rise in blood pressure normally following this effort.

Konopacka - Warsaw
